IMPORTANT

The purchaser must instruct all operators on the proper use of this equipment. All standard industrial safety measures and equipment should be provided to protect the operator. Operators must be cautioned that improper or careless use of this equipment may cause personal injury. If you do not have qualified operators to instruct new persons, contact your EASTMAN sales representative or EASTMAN factory direct.

Electrical connections and servicing to this equipment should be made by a qualified electrician who is familiar with applicable codes and regulations. Disconnect this equipment from electrical power source before proceeding with any disassembly for adjustment or repair.

Safety Information

Throughout this manual, safety information is presented by the use of the terms WARNING, CAUTION, ELECTRICAL HAZARD, and NOTE. These terms have the following meanings:

WARNING

A warning contains critical information regarding potential safety hazards that can occur during proper use or misuse of the machine. Failure to follow these procedures may result in serious personal injury to the user.

CAUTION

A caution contains instructions for the use or maintenance of the machine. Failure to follow these procedures may result in damage to the machine.

ELECTRICAL HAZARD

An electrical hazard calls attention to a procedure, practice, or the like, which, if not correctly performed or adhered to, could result in personal injury. Do not proceed beyond an Electrical Hazard.

Supplementary information may be given in a Note.

EasiLabel System Overview

The Eastman EasiLabel system is a next generation Eastman labeler as an optional gantry-mounted upgrade for the conveyor (C3) and static (S3) table series. The system utilizes permanent or removable adhesive labels in a variety of sizes to print, and place, directly onto patterned cut-outs. The EasiLabel is available in 2" and 4" roll widths, this allows for more flexibility during purchasing that will help best suit the needs for the systems primary application purposes. Label data comes directly from the cut file (text and/or barcode) and is thermally printed onto the label before application to the material. Eastman's label system reduces the time and effort required to manage cut pieces, and helps bring an overall organization to your workflow.

Before beginning operation, it is important that you carefully read and follow the instructions in this manual in the same sequence in which they are presented. Best results will be reached through a strong familiarization of the hardware and its operating system. Initial adjustments during set-up will be critical in the EasiLabel's performance.

Safety and Indemnification

During the life of the machine, the purchaser agrees to provide to all machine users (including its own employees and independent contractors) all relevant safety information, including warning labels and instruction manuals. The purchaser also agrees to maintain the safety features and working condition of the machine, and to adequately train all users in the safe use and maintenance of the machine. The purchaser agrees to defend, protect, indemnify, and hold Eastman Machine Company and its subsidiaries harmless from and against all claims, losses, expenses, damages, and liabilities to the extent that they have been caused by the purchaser's failure to comply with the terms and instructions of this manual.

General Safety Precautions

WARNING

- This machine is equipped with very sharp and dangerous tools. Keep hands, arms, and hair away from the cutting area and drive system at all times. Safety gloves, glasses, and appropriate clothing may prevent serious personal injuries.
- Disconnect the power supply to the machine when it is not in use or during routine maintenance, including cleaning and lubrication.
- The purchaser must instruct all operators in the proper use of the machine according to the instructions in this manual. This training must include instruction on the potential safety hazards arising from the use or misuse of the machine. In addition to such training, the purchaser should provide written work instructions as necessary to ensure correct use of the machine for specific cutting and spreading applications.
- Do not modify this machine or disable safety features. Unauthorized modification may result in serious personal injuries to the user. Electrical connections to this machine must be made by a qualified electrician familiar with applicable codes and regulations.
- Safety labels must be kept clean and legible at all times. Call the Eastman Machine factory to order replacement labels.

Familiarization

Overall Gantry Layout with EasiLabel

Labeler Mounting, Referenced Layout for both 2" Wide & 4" Wide Models.

- 1 - UIT(User Interface Terminal)
- 2 - Operator Side Cover Assembly
- 3 - Main Gantry Tube Assembly
- 4 - E-Chain Cover
- 5 - Y-Car & Tool Head Cover
- 6 - Non-Operator Side Cover Assembly
- 7 - EasiLabel System

Introduction

The Eastman EasiLabel system, as shown above, conventionally mounts directly to the back of the Y-Car with the help of a simple bracket mounting kit to maintain optimal functionality of your tool heads. With the mounting kit in place, (see pg. 13), the labeler is supported by four bolts fastened to the back of the Y-Car for easy connection and removal of the system.

Apart from a detailed parts description of the machine, this manual will also provide instructions for using the EasiLabel from a software stand point. The system runs on Eastman's branded cutting software, EastmanPRO.

This labeling system takes a TEXT entity from a drawing, and then replaces it with a physical label. Additionally, other information on the label field can be added as desired, such as fixed text, operator input text, barcode representations of text, and/or external data linked to a file. This gives the EasiLabel system a wide variety of printing layout options that best suits the needs of the desired work-flow.

EasiLabel Familiarization

Note: Full Main Frame & Cover Assembly (68-26483) not shown in view, see page 14.

Eastman®

Over a Century of Cutting Expertise

EasiLabel Setup

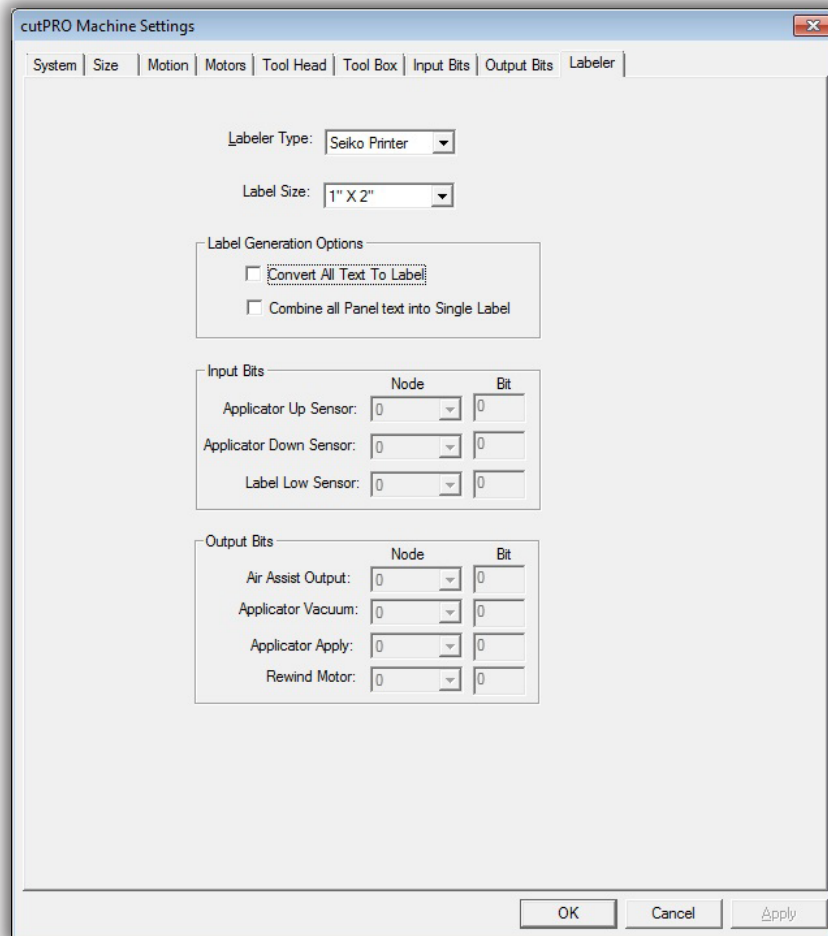

When the *Labeler* option is checked in EastmanPRO under the CutPro menu > Machine Settings > *System* tab, it notifies the system that the EasiLabel is physically attached to the machine.

This will display an additional tab named *Labeler*, also found on the Machine Settings page (shown in **Figure A**).

The physical labeler type and size are controlled directly from this tab, along with the options for processing the text entities when editing drawing files.

The *Convert All Text to Label* option will convert all drawing entities into labels. Otherwise only text articles on the layer titled *LabelLayer* will become the labels.

The *Combine all Panel text into Single Label* will group text from a Panel (PANO).

(Figure A)

Understanding Label Design Files

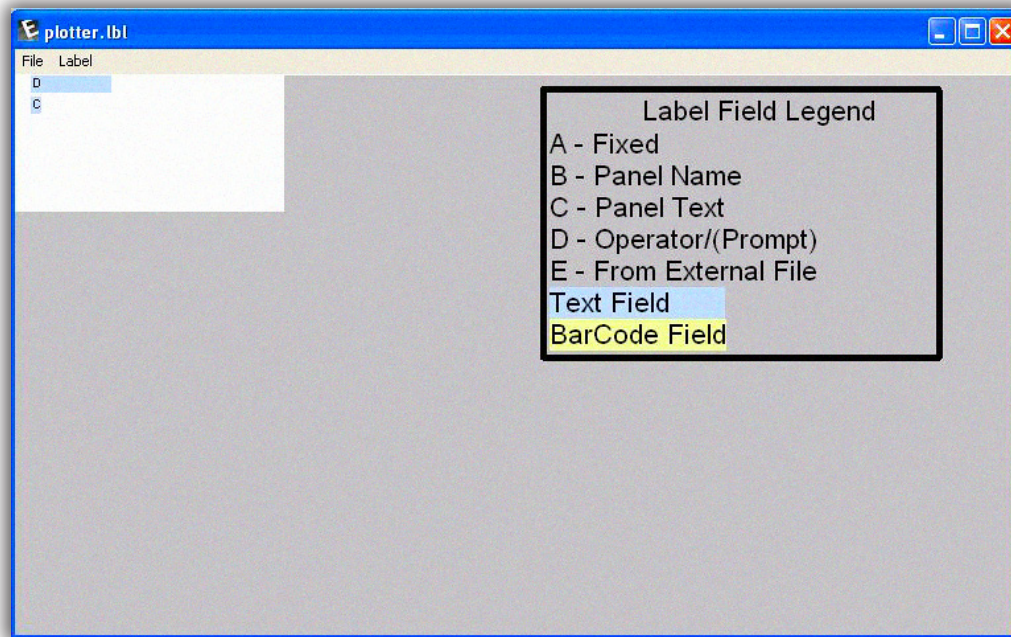

EastmanPRO uses label design, or configuration files, to specify what information is printed on the labels. These files are displayed with (.lbl) extensions.

When a drawing file is opened, it will use the default label configuration for the drawing, unless a configuration file with the same name as the drawing is found within the drawing directory.

The default configuration file is "*plotter.lbl*" and should reside in the same directory as the EastmanPRO application.

For example: If a file *C:\text.cmd* is opened and the label configuration file, *C:\text.lbl* exists, it will be used. Otherwise the default *plotter.lbl* file will take precedence.

Label configuration files are developed using the *Label Designer* integrated in the EastmanPRO software, (shown in **Figure B**).

(Figure B)

EastmanPRO Label Designer

The EastmanPRO *Label Designer* is used to design all label configuration files. It can be accessed under the CutPRO drop down menu.

The layout for the current label shown above (**Figure B**), is displayed in the *Label Designer* interface. The white box represents the physical label and any printable articles that it may contain. The location of each printable entity is specified in the *Label Field Legend* dialog box. This is indicated by a the blue and yellow rectangles. *Text Fields* are shown in blue, while *Barcode Fields* are shown in yellow. The height and width of each rectangle is meant to indicate the relative size of each corresponding field. In the case of the *Barcode Field*, the height of the yellow rectangle includes any human readable integrated (HRI) text included with the barcode symbol itself. The label legend is designed to act as a visual aid to help display where the physical label field gathers its data from.

The *Label Designer* program saves the label as an (.ascii) text file. This text file is then used by EastmanPRO to generate, process, and print the user specified format that was created in the *Label Designer* window.

File Menu

The File menu includes basic options familiar to Microsoft Windows based applications. The column to the right lays out these options and their functionality.

New

The New option erases the current label data and creates a new label using default settings. If the current label settings were not saved, a notification will remind the user.

Open

The Open option displays the standard File Open dialog box allowing the user to specify the name of any existing label files. The specified file is read into memory, and the label layout is displayed in the label print window. If the previous label settings were not saved, a notification will remind the user.

Save

The Save option is used to save the settings of the current label to a file. If no filename is associated with the label entity, a Save As dialog box will be displayed to allow the user to specify the name and location of the label file. The default filename extension for label files is (.lbl).

Save As

The Save As option saves the settings of the current label entity to a new file. The standard Save As dialog box is displayed to allow the user to specify the name and location of the new label. The default filename extension for label files is (.lbl).

The **Print** option is used to output the labels contents to the system printer.

Exit

Exits the Label Designer.

Eastman®

Over a Century of Cutting Expertise

Label Menu

The Label Menu contains options used to modify the contents and layout of the currently opened label.

Label Options Window

The *Label Options Window* displays a dialog box within which the user may specify general label layout and printing parameters. As shown in (Figure C).

Label Layout

The label *Width* and *Height* are specified in centimeters, and should correspond with the label size currently loaded in the system printer. When designing a new label, these fields will be set to the size specified on the CutPro > Machine Settings > Labeler tab.

The *Left Margin* specifies how far from the left edge of the label printing will start. This distance is also determined in centimeters.

In order to print a label upside-down, check the *Rotate 180 deg.* check box.

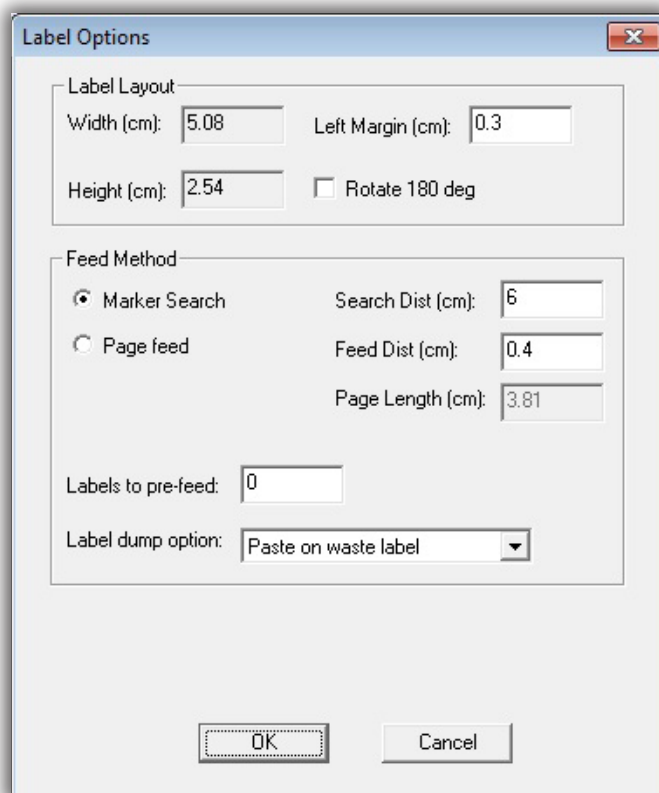

Feed Method

Thermal printers ordinarily support two methods of feeding label paper. The *Marker Search* method utilizes a registration mark on the paper roll. The *Search Distance* specifies the maximum distance that the printer will feed paper in search of the registered mark. The *Feed Distance* is the amount that the printer will feed the paper after the registration mark has been located. This distance is used to help align text at the top of the label.

The *Page Feed* method of feeding label paper relies on fixed label spacing which must be specified in the *Page Length* setting. Each time a form feed character is sent to the printer, the printer feeds the paper roll until the top of the next page (defined by the page length) is reached. This is similar to the mechanism used in conventional printers by using continuous form or "fanfold" paper.

The *Labels to Pre-feed* setting indicates how many labels exist between the print head and the label applicator. This will keep printed labels on a file in synch with their position as they are "printed ahead" of time by the number of pre-feed labels.

Label Dump Option specifies how to dispose of the pre-feed labels. The only option currently supported is *Paste on waste Label*, which will apply the pre-feed labels under the first valid label in a drawing file.

(Figure C)

Label Fields Window

The *Label Fields Window* displays a dialog box used to manipulate the text and barcode fields of the currently opened label. As shown in (Figure D).

The currently selected label field is shown in the *Field* control combo-box in the upper left. All settings displayed in the dialog box pertain to the currently selected field. Once all field changes have been made, click the *OK* button to save the settings. Click the *Cancel* button to cancel changes made to all fields (not only the currently selected field).

Click the *Add* button to add a new field to the label. A dialog box is displayed to allow entering the name of the field. Duplicate names are not allowed. Also, the name may not contain any spaces.

Click the *Delete* button to remove the currently selected field from the label.

The 'Label Fields' dialog box is shown with the following settings:

- Field: 1
- Line Number: 1
- Position (cm): 0
- Max Char: 15
- Source: Panel Text
- Item#: 1
- Text: (empty)
- Font: Standard 24
- Barcode: Text Field
- Barcode Height: Small
- Formatting options: Bold, Underline, Italic, Negative (all unchecked)
- Barcode options: No HRI Text, Text Below, Text Above, Both (all unchecked)

(Figure D)

The *Line Number* and *Position* settings specify the location of the field within the label. Since the printer adjusts the height of each printed line based on the height of the largest font used within that text line, the horizontal positioning of individual fields is limited. The top line of a label is line 1. Any blank lines within a label are treated as standard height of 16pt font lines, which is equivalent to about 3mm of blank space. The *Position* setting is the distance from the left margin as specified in the *Label Options* window (Figure C). It is equivalent to the distance from the left edge of the label only if the left margin setting is zero.

The *Source* combo-box contains a list of available text sources for the field. The available text sources are: *Fixed*, *Panel Name*, *Panel Text*, *Operator/(Prompt)* and *From External File*. The last source option is only available if the *Use External Data* option is checked in the *External Data* dialog box (Figure E). The *Fixed* source uses the text entered in the *Text* edit box when printing the label field. This source option should be used for all fields when developing a test label; all other options are meant to be used when developing a label file (*.lbl file) for use when printing. The *Panel Name* option causes the name of the panel, or part found in the drawing file, to be printed in the field. The *Panel Text* option prints the contents of a text entity found in the panel. The text entity is identified by entering its corresponding sequence number in the *Item#* edit box. The *Operator/(Prompt)* source indicates that the contents of the field will be designated by the operator when the drawing file is being prepared to be cut. The *Text* edit box is used to enter the edit box label that is displayed.

Available Font Types - Height Conversions to centimeters (cm) & inches (in).

Standard 24 = 24 dots/cm = 0.3cm or 0.118" high

Double Wide 24 = 24 dots/cm = 0.3cm or 0.118" high

Double High 24 = 48 dots/cm = 0.6cm or 0.23" high

Double High/Wide 24 = 48 dots/cm = 0.6cm or 0.23" high

Standard 16 = 16 dots/cm = 0.2cm or 0.08" high

Double Wide 16 = 16 dots/cm = 0.2cm or 0.08" high

Double High 16 = 32 dots/cm = 0.4cm or 0.157" high

Double High/Wide 16 = 32 dots/cm = 0.4cm or 0.157" high

*In reference to the *Font* combo-box, shown in (Figure D).

If the *From External File* source is selected, the field's contents are obtained from an external data file defined in the *External Data* dialog box (Figure E). Use the *Item#* edit box to specify the column or line item number of the field text within the external file. This source option is only available if the *Use External Data* option is checked in the *External Data* dialog box (Figure E). The external data file must have the same name as the drawing file.

The *Max Char* setting is used to specify the extent of the field in the label layout drawing and on the printed label. In the case of a *Fixed* source field, the *Text* string is truncated before printing if the string is longer than the *Max Char* setting. If the *Text* string is shorter than the *Max Char* setting, it is padded with spaces prior to printing. For all other source options, the name of the source is used as the field text. The name is truncated or padded with spaces, as required. For text fields, one of eight possible *Font* styles may be selected. The text may also be *Boldface* or *Underlined* with designated check boxes. The italics and negative options are permanently disabled, but will be included in later releases the software.

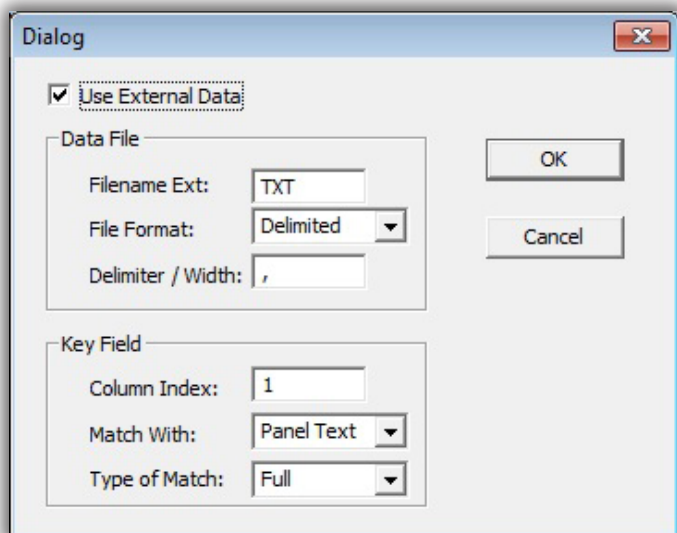

If a *Barcode* field is desired, one of seven available barcode types may be selected. Select one of the available locations for the human readable interpretation (HRI) text associated with the barcode. There is some built in validation of bar code entries, but users should be familiar with the limitations of certain barcode types. Also, *Barcode* fields must persist on their own line in the label file.

Eastman®

Over a Century of Cutting Expertise

Using External Data

The *External Data* option displays a dialog box used to specify the format of a text file which contains data for one or more label fields. These fields must have their *Source* set to *From External File*. The *Use External Data* option must be checked to enable use of an external text file for label text. As shown in (Figure E).

(Figure E)

Enter the filename extension of the external text file in the *Filename Ext* text box. The base filename of the external text file must be the same as the name of the corresponding drawing file. The *File Format* combo-box allows selection of a *Fixed Width*, or a *Delimited* option. If the external text file consists of fixed width columns, enter the column width in the *Delimiter / Width* text box. If the external text file consists of variable length, delimited text, enter the delimiter character in the *Delimiter / Width* text box. The most frequently used delimiter character is the comma.

The *Key Field* settings identify the entry within each line of the external text file that contains the text which specifies the drawing panel or part that corresponds to that line. The *Column Index* specifies the sequential index of the text entry within a line of text in the external file. The *Match With* combo-box is used to select the source of the text which must match the key field text (at *Column Index*) found in the external file. The *Panel Name* option is used if the key field text specifies the drawing panel or part name. The *Panel Text* option is used if the key field text matches the contents of the first text entity found in the drawing panel.

EasiLabel, Pneumatic Diagram 31-26798

EasiLabel, Mechanism Status Output

The following signals show the status of the interface:

LED1: Power: Indicates the status of a power supply periphery(except writing fonts).

LED2: Paper: Indicates the status of paper.

LED3: Error 1: Indicates various errors by combination of the LED3 and 4.

Printer Status signals

Printer Status Signal	LED1 (Green)	LED2 (Yellow)	LED3 (Red)	LED4 (Red)

Operation Errors

The type of operation errors can be judged from the LEDS. Moreover, that can be judged using the error status response command.

Problem	Solution
Out-of-paper error No paper	Load paper. Two ways to load paper: 1. Automatic Loading 2. Manual Loading
Paper-near-end error The paper near end sensor detects error status ("High")	Return the paper near end sensor to ("Low")
Platen open error The platen is up	Set down the platen.
VP voltage error VP is out of the allowable range (10.0V to 27.0V)	Non recoverable error.
Head Temperature error The temperature of the thermal head is -30C (-22F) or lower, or 80C (176F) or higher.	Goes to print ready status between ranges -25C (-13F) to 75C (167F).

Problem	Solution
Paper jam error Paper jam occurred when using an option sensor for auto-loading paper.	Remove paper.
Presenter jam error Paper jam occurred when the presenter feeds paper.	Non recoverable error.
Paper retract error Paper jam occurred when using an presenter for retracting paper.	Non recoverable error.
Option sensor error A valid option sensor detects error status ("High").	Return the variable option sensor to ("Low").

NOTE

The VP voltage allowable range is programmed to be from 10.0V to 27.0V in consideration of detection errors and instantaneous changes.

67-26941R	Labels, 2" x 1", 5500/Roll, Removable

Limited Warranty. Eastman warrants to the buyer that the EasiLabel system shall be free from defects in materials or workmanship for a period of 180 days commencing on the date of invoice. Any goods or parts claimed by the buyer to be defective must be returned to Eastman, freight charges prepaid, within the 180-day warranty period. If Eastman determines that the goods or parts are defective in materials or workmanship, Eastman's sole obligation under this warranty shall be, at Eastman's sole option, to repair or replace the defective goods or parts or to provide the buyer a credit equal to the portion of the purchase price allocable to the defective goods or parts. This warranty shall not apply if defects are caused by buyer, or if other than genuine Eastman belts are used in the machine. THIS WARRANTY IS THE ONLY WARRANTY APPLICABLE TO THIS PURCHASE. SELLER DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Limitation of Liability. Eastman's liability to the buyer, and the buyer's remedies from Eastman, whether in contract, negligence, tort, under any warranty or otherwise, shall be limited to the remedies provided in the foregoing Limited Warranty. In no event shall Eastman have any responsibility or liability to the buyer for (a) any special, indirect, incidental, or consequential damages, including, but not limited to, loss of use, revenue, or profit, even if Eastman has been advised of the possibility of such damages, or (b) any claim against the buyer by any third party. The price stated for the product sold is a consideration for limiting Eastman's liability.
